CUBE.AI Business Model Canvas

CUBE.AI: An Agentic AI Platform for Automated Radiology Research

Key Partners

- University Hospitals: Collaboration with institutions like Ain Shams University Hospital for real-world data and clinical testing.
- Faculty of Engineering: Technical backing from Cairo University (Systems and Biomedical Engineering)
- Tech Infrastructure: Use of open-source frameworks like NVIDIA MONAI, Orthanc, and OHIF.

Key Activities

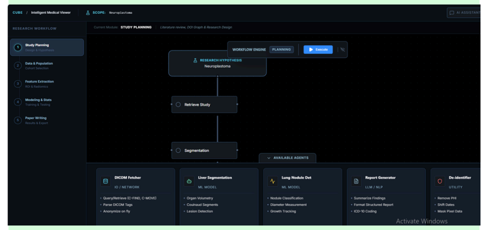
- R&D: Extending segmentation tools into a multi-agent LLM system for research assistance through AI-Researcher interaction.
- Software Development: Building a production-grade web Medical Viewer for radiology researchers based on OHIF.
- Clinical Validation: AI assisted segmentation supporting any organ in the body (>10 times faster) with accuracy matching expert radiologists.
- Datasets Preparation: Collaborative annotation of scares and difficult cases like Neuroblastoma.

Key Resources

- Proprietary Multi-Agent Stack: Powered by Microsoft AutoGen and MCP .
- Specialized Datasets: Access to pediatric cancer data (Neuroblastoma)
- Hardware: GPU workstations for model training
- Expert Team: Biomedical engineers and clinical supervisors from Cairo University.

Value Proposition

- Democratization: "No-code" AI development, allowing radiologists to build models without technical expertise.
- Extreme Efficiency: Reducing segmentation time from ~45 minutes to less than 1 minute in automatic mode.
- Agentic Research: An "AI Research Assistant" that collaborate and help in all research steps: hypothesis formulation, data preparation, modeling and measurements, and academic writing
- Cost-Efficiency: A local solution that avoids high foreign currency licensing fees.
- Data Privacy: on-premis solution that keeps your data safe and not sent to other third-party bodies.
- Compatibility: The solution can easily be installed and integrated with hospitals and centers systems.



Customer Relationships

- Co-Creation: Physicians act as "Human-in-the-Loop" to refine AI outputs.
- Trust & Transparency: A "Glass-Box" approach where the AI's reasoning process is visible to the doctor.
- Support: Providing clinical validation reports and user-focused technical support.
- Documentation: Provide user manuals and detailed steps for integration and installation as well as a detailed description for the features
- Customer Support: provide on demand support technically and research oriented in addition to continual improvements and upgrades

Customer Segments

- Primary: Radiologists and oncology departments in large public/private hospitals.
- Secondary: Medical researchers and academic institutions.
- Tertiary: Resource-constrained diagnostic clinics in rural areas.

Channels

- Direct Institutional Sales: B2B subscriptions for institutions (Hospitals, Universities, Research Centers).
- Academic Dissemination: Showcasing at research conferences (Medical - AI).
- Web Platform: Remote access for demo version and usability testing as well as custom version for remote users (AI as a Service).

Cost Structure

- Infrastructure & Hardware: Upgrading to high-end GPU workstations and cloud storage expansion.
- Operational Expenses: Stipends for clinical validation by expert radiologists
- Development Costs: Cloud infrastructure credits (AWS/Azure) for hosting the web platform.
- R&D: Continuous refinement of Agentic LLM reasoning and medical tool orchestration.

Revenue Streams

- Enterprise SaaS: Tiered subscription model for hospital diagnostic centers
- Academic Licensing: "Thesis Support" tool for medical faculties and post-graduates
- Consultancy & Integration: Custom integration fees for connecting to hospital PACS/HIS systems.
- Grants & Competitions: Funding from government innovation funds "under progress"
